

$$\mathcal{D}_a(\mathcal{M}) \quad \text{---} \text{I} \text{---} \quad \mathcal{D}_b(\mathcal{M}') = \mathcal{D}_a(\mathcal{M}) \quad \text{---} \quad \mathcal{D}_b(\mathcal{M})$$

The diagram illustrates a relationship between two sets of diagrams, $\mathcal{D}_a(\mathcal{M})$ and $\mathcal{D}_b(\mathcal{M})$. On the left, a diagram from $\mathcal{D}_a(\mathcal{M})$ (a vertical loop) is connected by a red line labeled I to a diagram from $\mathcal{D}_b(\mathcal{M}')$ (another vertical loop). A red line also connects the bottom of the first loop to the bottom of the second loop. This is followed by an equals sign and a single diagram from $\mathcal{D}_b(\mathcal{M})$ (a figure-eight shape), which is connected to $\mathcal{D}_a(\mathcal{M})$ by a red line at its top and to $\mathcal{D}_b(\mathcal{M})$ by a red line at its bottom.
